

Executive Summary

Nowadays there are a lot mobile applications which are very useful for users who already have a phone or a tablet. These applications can be acquired or downloaded free or by paying a true cost, so we can enjoy the features that they provide us.

The mobile applications can be of different categories such as: games, social networks, music, news, entertainment, sports, health, videos/films, maps/surf/search and so on.

There are some mobiles operating systems like: Android, iOS, Windows Phone, Symbian and BlackBerry; each one of them have shops of applications that operate in line, where we can search, download and install the application that satisfies with the user expectations.

This project seeks to know and understand the features and the performance, both Android operating system and the Poser Pro 2012 program. Besides it understands the development of an application with the name First aids that allow viewing videos or animation and how these techniques should be executed and procedures with character immediately.
